Product Description

The KXCJA-1028 is a tri-axis +/-4g, +/-8g or +/-16g silicon micromachined accelerometer. The sense element is fabricated using Kionix's proprietary plasma micromachining process technology. Acceleration sensing is based on the principle of a differential capacitance arising from acceleration-induced motion of the sense element, which further utilizes common mode cancellation to decrease errors from process variation, temperature, and environmental stress. The sense element is hermetically sealed at the wafer level by bonding a second silicon lid wafer to the device using a glass frit. A separate ASIC device packaged with the sense element provides signal conditioning and digital communications. The accelerometer is delivered in a 3 x 3 x 0.9 mm LGA plastic package operating from a 1.8 – 3.6V DC supply. Voltage regulators are used to maintain constant internal operating voltages over the range of input supply voltages. This results in stable operating characteristics over the range of input supply voltages and virtually undetectable ratiometric error. The I²C digital protocol is used to communicate with the chip to configure the part and monitor outputs.

Bandwidth (-3dB) ⁶	RES = 0	Hz		800	
	RES = 1	Hz		ODR/2	

Notes:

1. Current varies with Output Data Rate (ODR) (see table below), DRDY and WUF settings.
2. For I²C communication, this assumes a minimum 1.5kΩ pull-up resistor on SCL and SDA pins.
3. Start up time is from PC1 set to valid outputs. Time varies with Output Data Rate (ODR); see chart below.
4. Power up time is from Vdd and IO_Vdd valid to device boot completion.
5. User selectable through I²C.
6. User selectable and dependent on ODR and RES.

This product conforms to Directive 2002/95/EC of the European Parliament and of the Council of the European Union (RoHS). Specifically, this product does not contain lead, mercury, cadmium, hexavalent chromium, polybrominated biphenyls (PBB), or polybrominated diphenyl ethers (PBDE) above the maximum concentration values (MCV) by weight in any of its homogenous materials. Homogenous materials are "of uniform composition throughout."

This product is halogen-free per IEC 61249-2-21. Specifically, the materials used in this product contain a maximum total halogen content of 1500 ppm with less than 900-ppm bromine and less than 900-ppm chlorine.

Soldering

Soldering recommendations are available upon request or from www.kionix.com.

Floor Life

Factory floor life exposure of the KXCJA reels removed from the moisture barrier bag should not exceed a maximum of 168 hours at 30C/60%RH. If this floor life is exceeded, the parts should be dried per the IPC/JEDEC J-STD-033A standard.

KXCJA Digital Interface

The Kionix KXCJA digital accelerometer has the ability to communicate on the I²C digital serial interface bus. This allows for easy system integration by eliminating analog-to-digital converter requirements and by providing direct communication with system micro-controllers.

The serial interface terms and descriptions as indicated in Table 8 below will be observed throughout this document.

Term	Description
Transmitter	The device that transmits data to the bus.
Receiver	The device that receives data from the bus.
Master	The device that initiates a transfer, generates clock signals, and terminates a transfer.
Slave	The device addressed by the Master.

Table 8. Serial Interface Terminologies

I²C Serial Interface

As previously mentioned, the KXCJA has the ability to communicate on an I²C bus. I²C is primarily used for synchronous serial communication between a Master device and one or more Slave devices. The Master, typically a micro controller, provides the serial clock signal and addresses Slave devices on the bus. The KXCJA always operates as a Slave device during standard Master-Slave I²C operation.

I²C is a two-wire serial interface that contains a Serial Clock (SCL) line and a Serial Data (SDA) line. SCL is a serial clock that is provided by the Master, but can be held low by any Slave device, putting the Master into a wait condition. SDA is a bi-directional line used to transmit and receive data to and from the interface. Data is transmitted MSB (Most Significant Bit) first in 8-bit per byte format, and the number of bytes transmitted per transfer is unlimited. The I²C bus is considered free when both lines are high. The I²C interface is compliant with high-speed mode, fast mode and standard mode I²C standards.

± 4g / 8g / 16g Tri-axis Digital Accelerometer Specifications

PART NUMBER:

KXCJA-1028
Rev. 1
Sep-2014

Figure 1. Multiple KXCJA I²C Connection

I²C Operation

Transactions on the I²C bus begin after the Master transmits a start condition (S), which is defined as a high-to-low transition on the data line while the SCL line is held high. The bus is considered busy after this condition. The next byte of data transmitted after the start condition contains the Slave Address (SAD) in the seven MSBs (Most Significant Bits), and the LSB (Least Significant Bit) tells whether the Master will be receiving data '1' from the Slave or transmitting data '0' to the Slave. When a Slave Address is sent, each device on the bus compares the seven MSBs with its internally stored address. If they match, the device considers itself addressed by the Master. The KXCJA's Slave Address is comprised of a programmable part and a fixed part, which allows for connection of multiple KXCJA's to the same I²C bus. The Slave Address associated with the KXCJA is 000111X, where the programmable bit, X, is determined by the assignment of ADDR (pin 8) to GND or IO_Vdd. Figure 1 above shows how two KXCJA's would be implemented on an I²C bus.

It is mandatory that receiving devices acknowledge (ACK) each transaction. Therefore, the transmitter must release the SDA line during this ACK pulse. The receiver then pulls the data line low so that it remains stable low during the high period of the ACK clock pulse. A receiver that has been addressed, whether it is Master or Slave, is obliged to generate an ACK after each byte of data has been received. To conclude a transaction, the Master must transmit a stop condition (P) by transitioning the SDA line from low to high while SCL is high. The I²C bus is now free.

---	--	--

Writing to a KXCJA 8-bit Register

Upon power up, the Master must write to the KXCJA's control registers to set its operational mode. Therefore, when writing to a control register on the I²C bus, as shown Sequence 1 on the following page, the following protocol must be observed: After a start condition, SAD+W transmission, and the KXCJA ACK has been returned, an 8-bit Register Address (RA) command is transmitted by the Master. This command is telling the KXCJA to which 8-bit register the Master will be writing the data. Since this is I²C mode, the MSB of the RA command should always be zero (0). The KXCJA acknowledges the RA and the Master transmits the data to be stored in the 8-bit register. The KXCJA acknowledges that it has received the data and the Master transmits a stop condition (P) to end the data transfer. The data sent to the KXCJA is now stored in the appropriate register. The KXCJA automatically increments the received RA commands and, therefore, multiple bytes of data can be written to sequential registers after each Slave ACK as shown in Sequence 2 on the following page.

Reading from a KXCJA 8-bit Register

When reading data from a KXCJA 8-bit register on the I²C bus, as shown in Sequence 3 on the next page, the following protocol must be observed: The Master first transmits a start condition (S) and the appropriate Slave Address (SAD) with the LSB set at '0' to write. The KXCJA acknowledges and the Master transmits the 8-bit RA of the register it wants to read. The KXCJA again acknowledges, and the Master transmits a repeated start condition (Sr). After the repeated start condition, the Master addresses the KXCJA with a '1' in the LSB (SAD+R) to read from the previously selected register. The Slave then acknowledges and transmits the data from the requested register. The Master does not acknowledge (NACK) it received the transmitted data, but transmits a stop condition to end the data transfer. Note that the KXCJA automatically increments through its sequential registers, allowing data to be read from multiple registers following a single SAD+R command as shown below in Sequence 4 on the following page. The 8-bit register data is transmitted using a left-most format, first bit shifted/clocked out being the MSB bit.

If a receiver cannot transmit or receive another complete byte of data until it has performed some other function, it can hold SCL low to force the transmitter into a wait state. Data transfer only continues when the receiver is ready for another byte and releases SCL.

Data Transfer Sequences

The following information clearly illustrates the variety of data transfers that can occur on the I²C bus and how the Master and Slave interact during these transfers. Table 9 defines the I²C terms used during the data transfers.

Term	Definition
S	Start Condition
Sr	Repeated Start Condition
SAD	Slave Address
W	Write Bit
R	Read Bit
ACK	Acknowledge
NACK	Not Acknowledge
RA	Register Address
Data	Transmitted/Received Data
P	Stop Condition

Table 9. I²C Terms

Sequence 1. The Master is writing one byte to the Slave.

Master	S	SAD + W		RA		DATA		P
Slave			ACK		ACK		ACK	

Sequence 2. The Master is writing multiple bytes to the Slave.

Master	S	SAD + W		RA		DATA		DATA		P
Slave			ACK		ACK		ACK		ACK	

Sequence 3. The Master is receiving one byte of data from the Slave.

Master	S	SAD + W		RA		Sr	SAD + R			NACK	P
Slave			ACK		ACK			ACK	DATA		

Sequence 4. The Master is receiving multiple bytes of data from the Slave.

Master	S	SAD + W		RA		Sr	SAD + R			ACK		NACK	P
Slave			ACK		ACK			ACK	DATA		DATA

KXCJA Register Descriptions

Accelerometer Outputs

These registers contain up to 12-bits of valid acceleration data for each axis depending on the setting of the RES bit in CTRL_REG1, where the acceleration outputs are represented in 12-bit valid data when RES = '1' and 8-bit valid data when RES = '0'. The data is updated every user-defined ODR period, is protected from overwrite during each read, and can be converted from digital counts to acceleration (g) per Table 11 below. The register acceleration output binary data is represented in 2's complement format. For example, if N = 12 bits, then the Counts range is from -2048 to 2047, and if N = 8 bits, then the Counts range is from -128 to 127.

12-bit Register Data (2's complement)	Equivalent Counts in decimal	Range = +/-4g	Range = +/-8g	Range = +/-16g

DCST_RESP

This register can be used to verify proper integrated circuit functionality. It always has a byte value of 0x55h unless the DCST bit in CTRL_REG3 is set. At that point this value is set to 0xAAh. The byte value is returned to 0x55h after reading this register.

Interrupt Source Registers

These two registers report interrupt state changes. This data is updated when a new interrupt event occurs and each application's result is latched until the interrupt release register is read. The programmable interrupt engine can be configured to report data in an unlatched manner via the interrupt control registers.

INT_SOURCE1

This register reports which function caused an interrupt. Reading from the interrupt release register (INT_REL, 0x1Ah) will clear the entire contents of this register.

R	R	R	R	R	R	R	R
0	0	0	DRDY	0	0	WUFS	0
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
I ² C Address: 0x16h							

DRDY - indicates that new acceleration data (at Reg Addr 0x06h to 0x0Bh) is available. This bit is cleared when acceleration data is read or the interrupt release register (INT_REL, 0x1Ah) is read.

- 0 = New acceleration data not available
- 1 = New acceleration data available

WUFS - Wake up, This bit is cleared when the interrupt source latch register (INT_REL, 0x1Ah) is read.

- 0 = No motion
- 1 = Motion has activated the interrupt

STATUS_REG

This register reports the status of the interrupt.

R	R	R	R	R	R	R	R
0	0	0	INT	0	0	0	0
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
I ² C Address: 0x18h							

INT reports the combined (OR) interrupt information of DRDY and WUFS in the interrupt source register (INT_SOURCE1, 0x16h). This bit is cleared when acceleration data is read or the interrupt release register (INT_REL, 1Ah) is read.

0 = no interrupt event

1 = interrupt event has occurred

INT_REL

Latched interrupt source information (INT_SOURCE1, 0x16h and INT_SOURCE2, 0x17h) is cleared and physical interrupt latched pin (7) is changed to its inactive state when this register is read.

CTRL_REG1

Read/write control register that controls the main feature set.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
PC1	RES	DRDYE	GSEL1	GSEL0	0	WUFE	0	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000000
I ² C Address: 0x1Bh								

PC1 controls the operating mode of the KXCJA.

- 0 = disabled mode
- 1 = operating mode

RES determines the performance mode of the KXCJA. Note that to change the value of this bit, the PC1 bit must first be set to "0".

- 0 = low current, 8-bit valid. Only available for ODR ≤ 200 Hz. Bandwidth (Hz) = 800
- 1 = high current, 12-bit or 14-bit valid. Bandwidth (Hz) = ODR/2

DRDYE enables the reporting of the availability of new acceleration data as an interrupt. Note that to change the value of this bit, the PC1 bit must first be set to "0".

- 0 = availability of new acceleration data is not reflected as an interrupt
- 1 = availability of new acceleration data is reflected as an interrupt

GSEL1, GSEL0 selects the acceleration range of the accelerometer outputs per Table 13. Note that to change the value of this bit, the PC1 bit must first be set to "0".

GSEL1	GSEL0	Range
0	0	+/-4g
0	1	+/-8g
1	0	+/-16g
1	1	+/-16g ¹

Table 13. Selected Acceleration Range

WUFE enables the Wake Up (motion detect) function. 0= disabled, 1= enabled. Note that to change the value of this bit, the PC1 bit must first be set to "0".

- 0 = Wake Up function disabled
- 1 = Wake Up function enabled

¹ This is a 14-bit mode available only in Full Power mode and only for Registers 0x06h-0x0Bh

± 4g / 8g / 16g Tri-axis Digital Accelerometer Specifications

CTRL_REG2

Read/write control register that provides more feature set control. Note that to properly change the value of this register, the PC1 bit in CTRL_REG1 must first be set to "0".

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
SRST	reserved	reserved	DCST	reserved	OWUFA	OWUFB	OWUFC	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000000
I ² C Address: 0x1Dh								

SRST initiates software reset, which performs the RAM reboot routine. This bit will remain 1 until the RAM reboot routine is finished.

SRST = 0 – no action

SRST = 1 – start RAM reboot routine

DCST initiates the digital communication self-test function.

DCST = 0 – no action

DCST = 1 – sets ST_RESP register to 0xAAh and when ST_RESP is read, sets this bit to 0 and sets ST_RESP to 0x55h

OWUFA, OWUFB, OWUFC sets the Output Data Rate for the Wake Up function (motion detection) per Table 14 below

OWUFA	OWUFB	OWUFC	Wake Up function Output Data Rate
0	0	0	0.781Hz
0	0	1	1.563Hz
0	1	0	3.125Hz
0	1	1	6.25Hz
1	0	0	12.5Hz
1	0	1	25Hz
1	1	0	50Hz
1	1	1	100Hz

Table 14. Output Data Rate for Wake Up Function

± 4g / 8g / 16g Tri-axis Digital Accelerometer Specifications

INT_CTRL_REG1

This register controls the settings for the physical interrupt pin (7). Note that to properly change the value of this register, the PC1 bit in CTRL_REG1 must first be set to “0”.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
0	0	IEN	IEA	IEL	0	0	0	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00010000
I ² C Address: 0x1Eh								

IEN enables/disables the physical interrupt pin (7)

IEN = 0 – physical interrupt pin (7) is disabled

IEN = 1 – physical interrupt pin (7) is enabled

IEA sets the polarity of the physical interrupt pin (7)

IEA = 0 – polarity of the physical interrupt pin (7) is active low

IEA = 1 – polarity of the physical interrupt pin (7) is active high

IEL sets the response of the physical interrupt pin (7)

IEL = 0 – the physical interrupt pin (7) latches until it is cleared by reading INT_REL

IEL = 1 – the physical interrupt pin (7) will transmit one pulse with a period of 0.03 - 0.05ms

INT_CTRL_REG2

This register controls which axis and direction of detected motion can cause an interrupt. Note that to properly change the value of this register, the PC1 bit in CTRL_REG1 must first be set to “0”.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
0	0	XNWUE	XPWUE	YNWUE	YPWUE	ZNWUE	ZPWUE	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00111111
I ² C Address: 0x1Fh								

XNWU - x negative (x-): 0 = disabled, 1 = enabled

XPWU - x positive (x+): 0 = disabled, 1 = enabled

YNWU - y negative (y-): 0 = disabled, 1 = enabled

YPWU - y positive (y+): 0 = disabled, 1 = enabled

ZNWU - z negative (z-): 0 = disabled, 1 = enabled

ZPWU - z positive (z+): 0 = disabled, 1 = enabled

DATA_CTRL_REG

Read/write control register that configures the acceleration outputs. Note that to properly change the value of this register, the PC1 bit in CTRL_REG1 must first be set to "0".

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
0	0	0	0	OSAA	OSAB	OSAC	OSAD	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000010
I ² C Address: 0x21h								

OSAA, OSAB, OSAC, OSAD sets the output data rate (ODR) for the low-pass filtered acceleration outputs per

Table 15.

OSAA	OSAB	OSAC	OSAD	Output Data Rate	LPF Roll-Off
1	0	0	0	0.781Hz	0.3905Hz
1	0	0	1	1.563Hz	0.781Hz
1	0	1	0	3.125Hz	1.563Hz
1	0	1	1	6.25Hz	3.125Hz
0	0	0	0	12.5Hz	6.25Hz
0	0	0	1	25Hz	12.5Hz
0	0	1	0	50Hz	25Hz
0	0	1	1	100Hz	50Hz
0	1	0	0	200Hz	100Hz
0	1	0	1	400Hz	200Hz
0	1	1	0	800Hz	400Hz
0	1	1	1	1600Hz	800Hz

Table 15. Acceleration Output Data Rate (ODR) and LPF Roll-Off

Note: Output Data Rates >= 400Hz will force device into Full Power mode

WAKEUP_TIMER

This register sets the time motion must be present before a wake-up interrupt is set. Every count is calculated as 1/OWUF delay period. Note that to properly change the value of this register, the PC1 bit in CTRL_REG1 must first be set to "0". Valid Entries are 1 to 255, zero is excluded.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
WUFC7	WUFC6	WUFC5	WUFC4	WUFC3	WUFC2	WUFC1	WUFC0	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000000
I ² C Address: 0x29h								

SELF_TEST

When 0xCA is written to this register, the MEMS self-test function is enabled. Electrostatic-actuation of the accelerometer, results in a DC shift of the X, Y and Z axis outputs. Writing 0x00 to this register will return the accelerometer to normal operation.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000000
I ² C Address: 0x3Ah								

WAKEUP_THRESHOLD

This register sets the threshold for wake-up (motion detect) interrupt is set. The KXCJA will ship from the factory with this value set to correspond to a change in acceleration of 0.5g. Note that to properly change the value of this register, the PC1 bit in CTRL_REG1 must first be set to "0".

KXCJA Embedded Wake Up Function

The KXCJA contains an interrupt engine that can be configured by the user to report when qualified changes in acceleration occur. The user has the option to enable or disable specific axes and specific directions, as well as to specify the delay time. An example use case for the engine would be to detect motion on any axis to signal an event and wake up the accelerometer or other devices. This can be achieved by configuring the engine to detect when the acceleration on any axis is greater than the user-defined threshold for a user-defined amount of time. Equations 1 and 2 show how to calculate the engine threshold (WAKEUP_THRESHOLD) and delay time (WAKEUP_TIMER) register values for the desired result.

$$WAKEUP_THRESHOLD \text{ (counts)} = \text{Desired Threshold (g)} \times 8 \text{ (counts/g)}$$

Equation 1. Wake Up Threshold

$$WAKEUP_TIMER \text{ (counts)} = \text{Desired Delay Time (sec)} \times OWUF \text{ (Hz)}$$

Equation 2. Wake Up Delay Time

	± 4g / 8g / 16g Tri-axis Digital Accelerometer Specifications	PART NUMBER: KXCJA-1028 Rev. 1 Sep-2014
---	--	--

Figure 2 below shows the latched response of the Wake Up Function with WUF Timer = 10 counts.

Typical Wake Up Interrupt Example

Figure 2. Latched Motion Interrupt Response

The KXCJA-1028 wake-up function is always latched. However, if the INT_CTRL_REG1 is set with IEL = 1, then upon a wake-up event the WUF interrupt signal will pulse and return low, but only once. The WUF interrupt output will not reset until a read of the INT_REL latch reset register.
